

# Boolean Operation

Some operations of ordinary algebra, in particular, multiplication  $xy$ , addition  $x + y$ , and negation  $x$ , have their counterparts in Boolean algebra. Those operations are :-

- ▶ AND
- ▶ OR
- ▶ NOT

# Basic Boolean operators

- ▶ AND - It's symbol is  $\wedge$  and it is used as multiplication counterpart of linear algebra. It is called conjunction in boolean language.
- ▶ OR - It's symbol is  $\vee$  and it is used as addition counterpart of linear algebra. It is called disjunction in boolean language.
- ▶ NOT - Its symbol is  $\neg$  and it is used as negation counterpart of linear algebra. It is called negation or complement in boolean language.

# AND operator

Figure: The distinctive shape of AND gate

The AND gate is a basic digital logic gate that implements logical conjunction. A HIGH output(1) results only if both the inputs to the AND gate are HIGH (1). If neither or only one input to the AND gate is HIGH, a LOW output results.

| input in A | input in B | output(A AND B) |
|------------|------------|-----------------|
| 0          | 0          | 0               |
| 0          | 1          | 0               |
| 1          | 0          | 0               |
| 1          | 1          | 1               |

Table: showing the result of AND operator for different values of A and B

# OR operator

Figure: The distinctive shape of OR gate

The OR gate is a digital logic gate that implements logical disjunction. A HIGH output (1) results if one or both the inputs to the gate are HIGH (1). If neither input is HIGH, a LOW output (0) results.

| input in A | input in B | output(A OR B) |
|------------|------------|----------------|
| 0          | 0          | 0              |
| 0          | 1          | 1              |
| 1          | 0          | 1              |
| 1          | 1          | 1              |

Table: showing the result of OR operator for different values of A and B

# NOT operator

Figure: The distinctive shape of NOT gate

A NOT gate is a logic gate which implements logical negation.

| input in A | output in A |
|------------|-------------|
| 0          | 1           |
| 1          | 0           |

Table: showing the result of OR operator for different values of A and B

# De Morgan's Laws in Boolean Algebra

## First Law

*The negation of a conjunction is the disjunction of the negations.*

## Second Law

*The negation of a disjunction is the conjunction of the negations.*

The two laws can be stated in mathematical statement or boolean language for two boolean values P and Q as :-

$$\neg(P \wedge Q) \iff (\neg P) \vee (\neg Q)$$

$$\neg(P \vee Q) \iff (\neg P) \wedge (\neg Q)$$

# First Law

**The negation of a conjunction is the disjunction of the negations.**

Proof.

| P | Q | $P \wedge Q$ | $\neg(P \wedge Q)$ | $\neg P$ | $\neg Q$ | $\neg(P) \vee \neg(Q)$ |
|---|---|--------------|--------------------|----------|----------|------------------------|
| 0 | 0 | 0            | 1                  | 1        | 1        | 1                      |
| 0 | 1 | 1            | 0                  | 1        | 0        | 0                      |
| 1 | 0 | 1            | 0                  | 0        | 1        | 0                      |
| 1 | 1 | 1            | 0                  | 0        | 0        | 0                      |

From the table, it can be easily seen that

$$\neg(P \wedge Q) \iff (\neg P) \vee (\neg Q)$$

## Second Law

**The negation of a disjunction is the conjunction of the negations.**

Proof.

| $p$ | $q$ | $p \vee q$ | $\neg(p \vee q)$ | $\neg p$ | $\neg q$ | $(\neg p) \wedge (\neg q)$ |
|-----|-----|------------|------------------|----------|----------|----------------------------|
| 0   | 0   | 0          | 1                | 1        | 1        | 1                          |
| 0   | 1   | 0          | 1                | 1        | 0        | 1                          |
| 1   | 0   | 0          | 1                | 0        | 1        | 1                          |
| 1   | 1   | 1          | 0                | 0        | 0        | 0                          |

From the table, it can be easily seen that

$$\neg(P \vee Q) \iff (\neg P) \wedge (\neg Q)$$

# De Morgan's laws for n variables $A_i$

For n variables ,De Morgan's laws are genrally written as:

$$\overline{\bigcap_{i \in I} A_i} \equiv \bigcup_{i \in I} \overline{A_i}$$

$$\overline{\bigcup_{i \in I} A_i} \equiv \bigcap_{i \in I} \overline{A_i}$$

where I is the set of n variables  $A_i$
